

Allergy tissue therapy

The Danish veterinary surgeon Hans Jorgen Jensen (Stenlille Vet clinic) has learned this therapy from a Russian vet. Dr. Jensen has operated on about 100 allergic dogs (by 2009) with very successful results.

About allergy

Allergy is an exaggerated immune response that is manifested by inflammation. An allergen is any substance that can cause an allergy.

Tissue therapy

The tissue therapy is simply implantation of a piece of oxhide just under the skin at the dog's upper chest. The oxhide must be ripened a couple of days in the fridge before implantation. The dog is treated with penicillin before and after the implantation.

Results

Mostly the therapy works immediately, occasionally the therapy has to be repeated. Very rarely the therapy does not help. Thus naturally there is no guarantee that the therapy helps.
